# **Optional Chaining**

**By Satyawan Panchal**

# Optional Chaining

Introduction in **ECMAScript 2020**, is a feature that simplifies the process of accessing properties and methods of nested objects or arrays when intermediate properties may be null or undefined.

The optional chaining operator  
→ `(?.)`  
It allows you to access properties.

# Outline

**01** Objects

**02** Ways to create

**03** Object Methods

**04** Uses of objects

Along with examples

# WAYS TO CREATE OBJECTS

## Object literal

```
const obj = { key: "value" };
```

## new Object()

```
const obj = new Object();  
obj.key = "value";
```

# WAYS TO CREATE OBJECTS

## Constructor function

```
function Person(name) {  
  this.name = name;  
}  
const p1 = new Person("Riya")
```

## Class

**(syntactic sugar)**

```
class Person {  
  constructor(name) {  
    this.name = name;  
  }  
}
```

# WAYS TO CREATE OBJECTS

## Object.create()

```
const proto = {  
  greet() {  
    return "Hello";  
  }  
};  
const obj = Object.create(proto);
```

# OBJECT METHODS

```
graph TD; Root[OBJECT METHODS] --- HLine[ ]; HLine --- Node1(( )); HLine --- Node2(( )); HLine --- Node3(( )); HLine --- Node4(( )); HLine --- Node5(( )); HLine --- Node6(( )); HLine --- Node7(( )); Node1 --- Box1[Object.keys(obj)  
array of keys]; Node2 --- Box2[Object.values(obj)  
array of values]; Node3 --- Box3[Object.entries(obj)  
array of [key, value] pairs]; Node4 --- Box4[Object.assign(target, source)  
copies properties]; Node5 --- Box5[Object.freeze(obj)  
makes object immutable]; Node6 --- Box6[Object.seal(obj)  
prevents adding/removing  
properties but allows  
modification]; Node7 --- Box7[Object.hasOwn(obj, prop)  
checks if property exists  
directly];
```

**Object.keys(obj)**  
array of keys

**Object.values(obj)**  
array of values

**Object.entries(obj)**  
array of [key, value] pairs

**Object.assign(target, source)**  
copies properties

**Object.freeze(obj)**  
makes object immutable

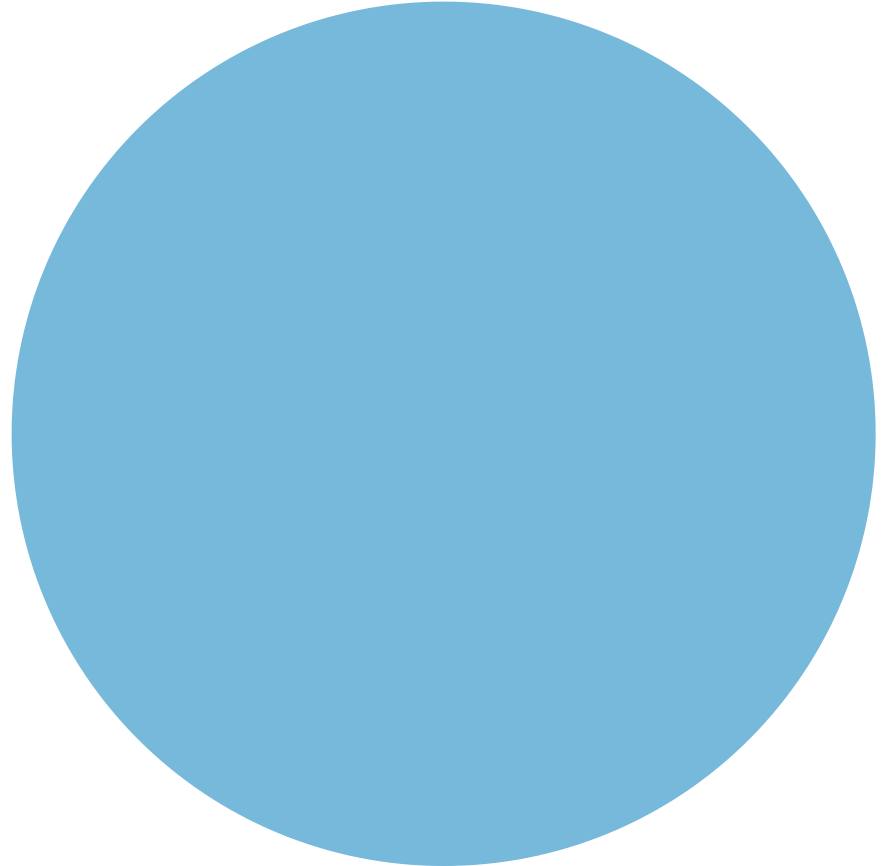

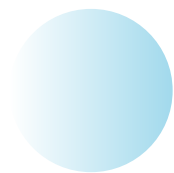

**Object.seal(obj)**  
prevents adding/removing  
properties but allows  
modification

**Object.hasOwn(obj, prop)**  
checks if property exists  
directly

# Uses of Objects

1. Store structured data (person, product, settings, etc.).
  2. Group related functionality (methods inside).
  3. Represent real-world entities (students, employees, etc.).
  4. Use as a map/dictionary (key-value storage).
  5. Backbone of OOP in JavaScript.
- 
- 
- 

# Misconceptions

1. ❌ Objects and arrays are different  
✅ Arrays are also objects with numeric keys.
2. ❌ Objects are unordered.  
✅ Since ES2015, object keys maintain order (integers sorted, strings insertion order).

# Misconceptions

3. ❌ this always refers to object itself  
✅ It depends on how function is called.
4. ❌ Objects can only have string keys  
✅ Keys can also be symbols.

# FACTS

- 1.** `Object.freeze()` is shallow → nested objects are still mutable
- 2.** Property names are always strings or symbols → numbers are converted to strings
- 3.** You can make objects without prototypes (`Object.create(null)`).
- 4.** Functions in JS are also objects → they can have properties

# Common Mistakes

 Wrong	 Right
<pre>person = { name: "Kanak" };</pre>	<pre>const person = { name: "Kanak" };</pre>
<pre>const obj2 = obj1;</pre>	<pre>const obj2 = { ...obj1 }; OR const obj2 = structuredClone(obj1);</pre>
<pre>obj.name = "Varsha"; // when frozen</pre>	<pre>const newObj = { ...obj, name: "Varsha" };</pre>
<pre>for (let key in obj) { ... }</pre>	<pre>Object.keys(obj).forEach(key =&gt; {...});</pre>
<pre>greet: () =&gt; console.log(this.name)</pre>	<pre>greet() { console.log(this.name); }</pre>
<pre>const copy = { ...obj }; // shallow</pre>	<pre>const copy = structuredClone(obj);</pre>
<pre>const obj = { toString: "Hello" };</pre>	<pre>const obj = Object.create(null); obj.name = "Kanak";</pre>
<pre>user.profile.name</pre>	<pre>user?.profile?.name</pre>
<pre>{ a: 1 } === { a: 1 } // false</pre>	<pre>JSON.stringify(obj1) === JSON.stringify(obj2)</pre>

**HANDS-ON PRACTICAL**

# QUESTIONS FOR YOU

**01** How are arrays also objects in JavaScript?

**02** Create an object car with properties brand, model, and year. Add a method getDetails() that returns a string describing the car.

**03** Why does this fail? How can it be fixed?

```
const person = {  
  name: "Kanak",  
  greet: () => console.log(this.name)  
};  
person.greet();
```

**04** Use Object.keys(), Object.values(), and Object.entries() on the object below and write the outputs:

```
const student = { name: "Riya", age: 20, grade: "A" };
```
